

# EB Cloud behind Dirigo

Elektrobit

Thomas Fleischmann, Rainer Hungershausen  
5<sup>th</sup> June 2015

# Agenda

## EB Cloud

How things were done in the past

Cloud Computing

Scalability

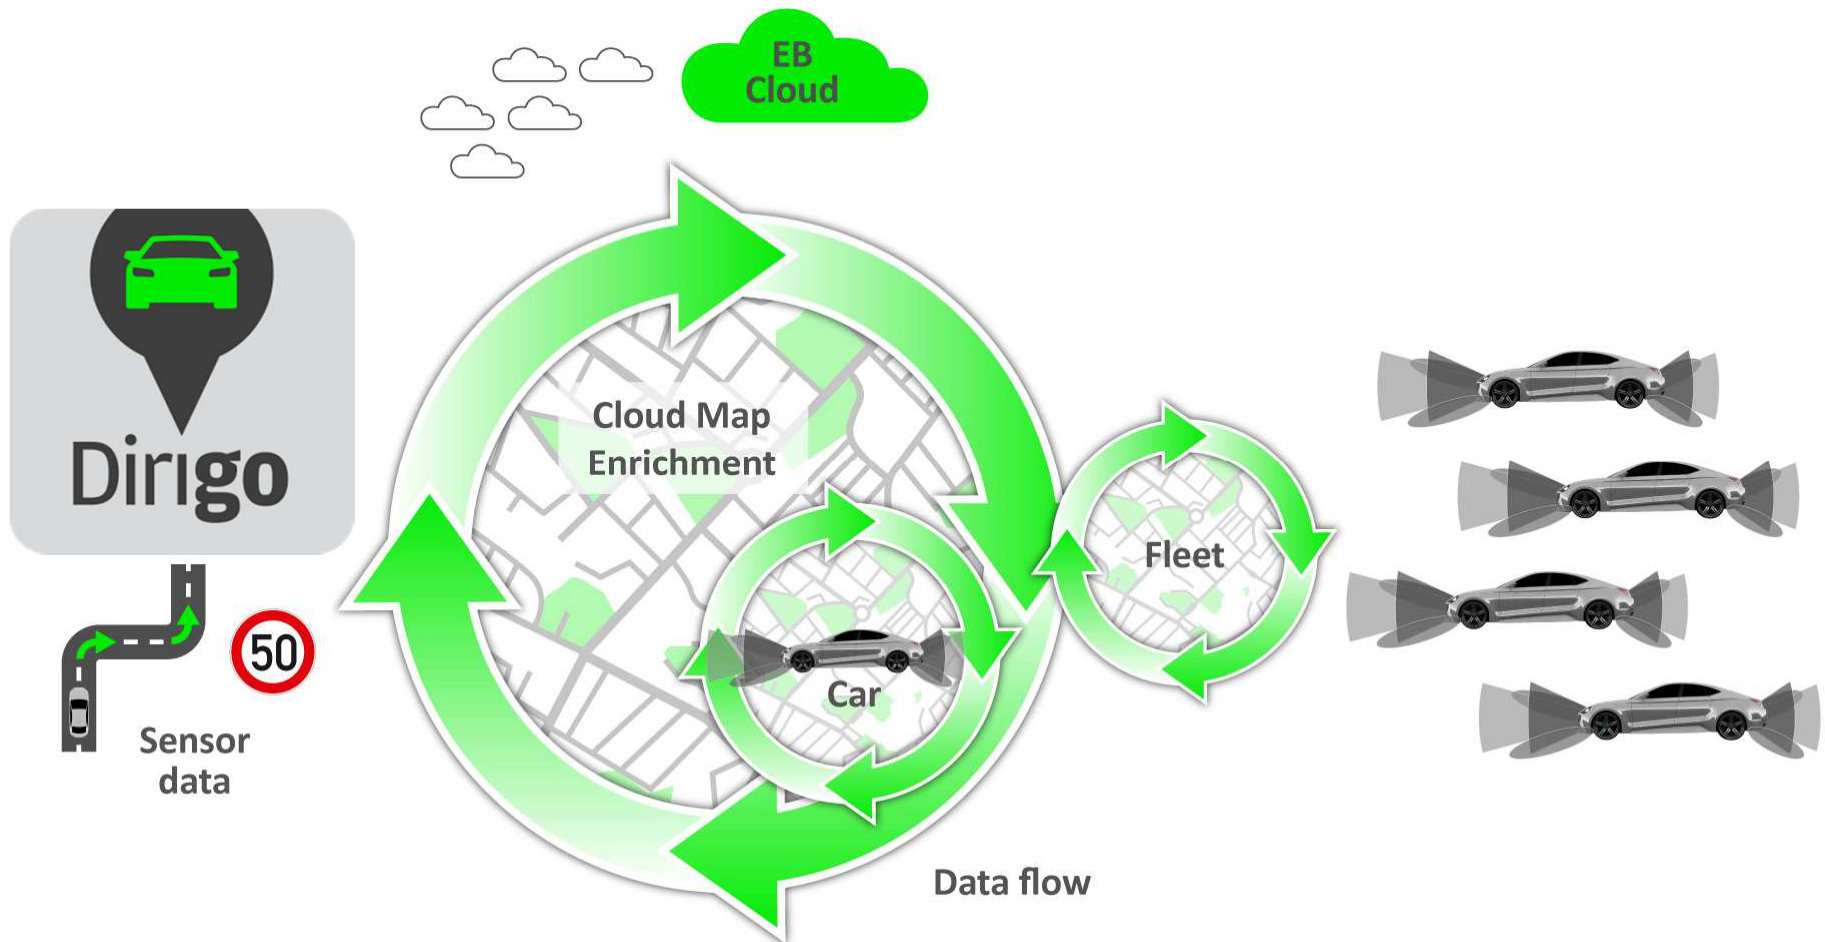

Availability

Cost & Operations

Overview & Outlook

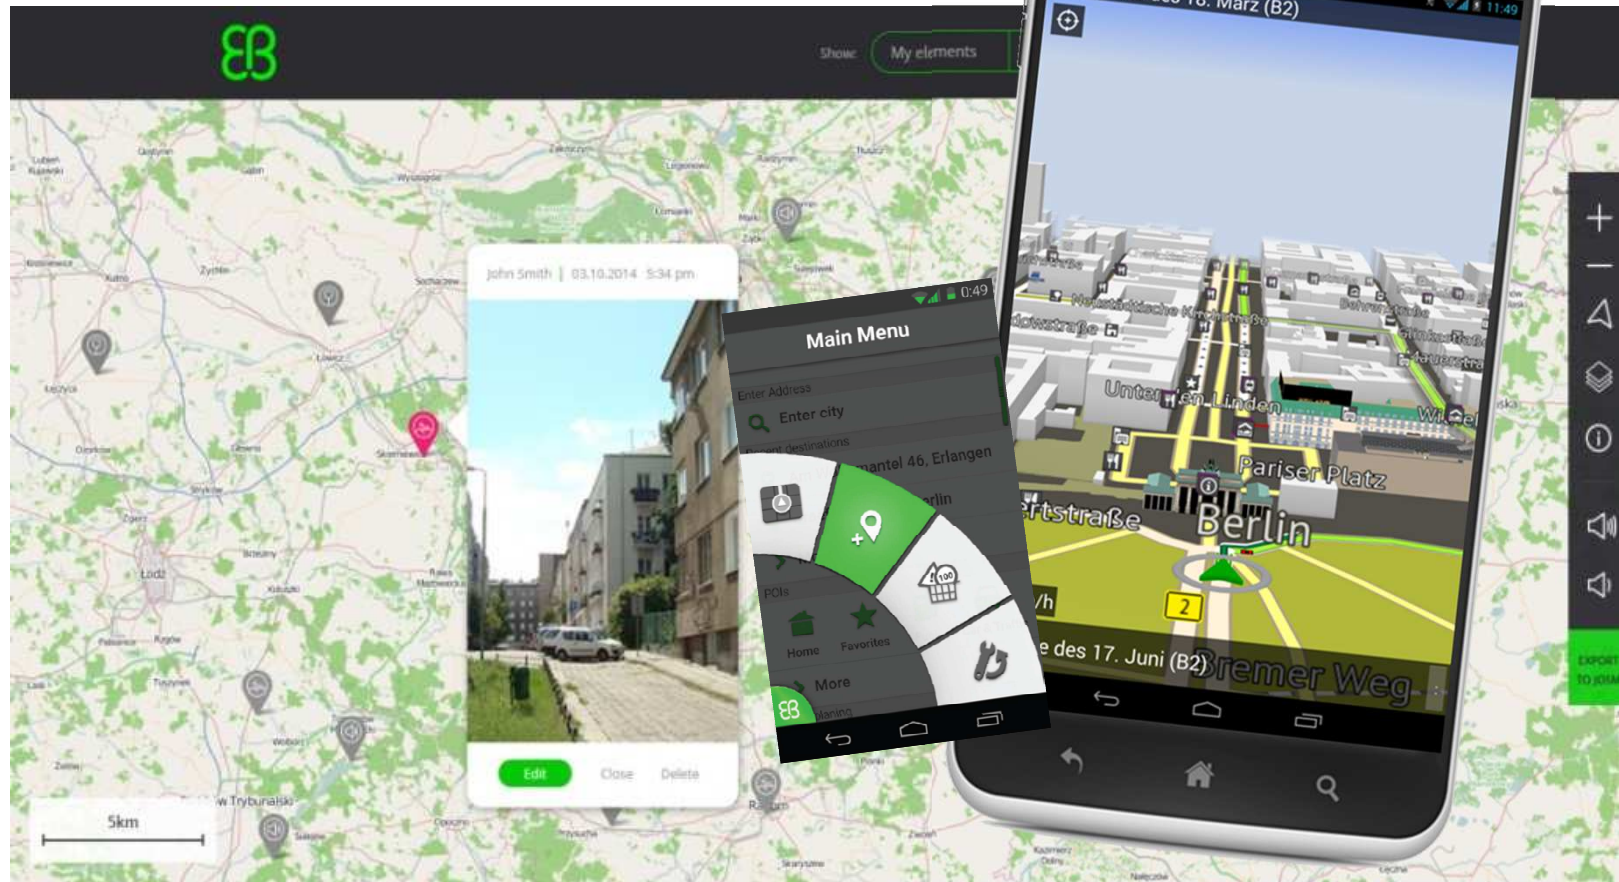

# EB Dirigo to kickstart the learning cloud

It is up and running!

[www.ebdirigo.com](http://www.ebdirigo.com)

# Agenda

---

EB Cloud

**How things were done in the past**

Cloud Computing

Scalability

Availability

Cost & Operations

Overview & Outlook

# Typical Multi-Tier Web Application

---

## Rollout at the customer's site

---

- Maintenance window
- Migrate database
- Deliver application (.war file) to the customer
- Customer IT responsible for keeping the server alive

# Agenda

---

EB Cloud

How things were done in the past

**Cloud Computing**

Scalability

Availability

Cost & Operations

Overview & Outlook

# Cloud Computing

---

- Infrastructure as a Service (IaaS)
  - Virtual Machines
  - Load Balancers
  - Disk Storage
- Platform as a Service (PaaS)
  - Elastic Beanstalk/Lambda
- Software as a Service (SaaS)
  - Google Drive/Apple iCloud

# Goals for the Dirigo cloud service

---

- Scalability
  - Expected a couple thousand users after launch
  - Later maybe cars in the millions
  - Fast response times for users
- Availability
  - No maintenance windows
  - Seamless software updates
  - Fault tolerance
- Cost reduction
  - Save cost in operations
  - Scale hardware costs with amount of users
- Security and Privacy

# Agenda

EB Cloud

How things were done in the past

Cloud Computing

**Scalability**

Availability

Cost & Operations

Overview & Outlook

# Scaling types

---

Vertical / Scale up

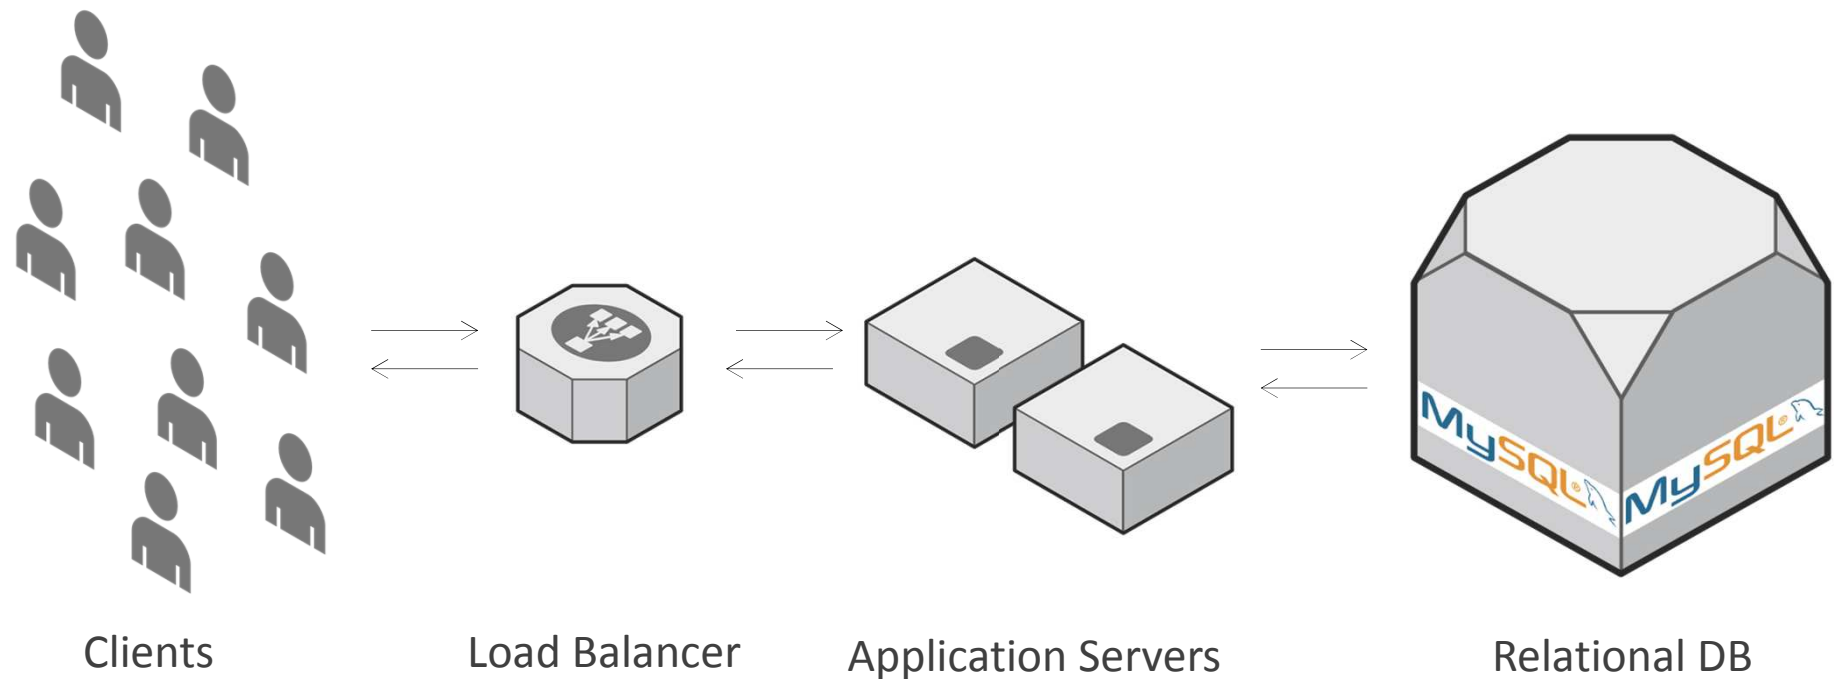

Horizontal / Scale out

# Scaled web application

---

# NoSQL Databases

---

- Different types for different problems
- Often horizontally scalable
- Schema-less
- Think about data usage, then store for optimized access
- Good shard key is important
  - Avoid sequences
  - Pick one with a good distribution

# Performance tests

- Find bottlenecks in the system
- Simulate typical workloads
- Ramp up the load until system saturates/collapses

# Monitoring

- Environment
  - Amazon Cloudwatch
  - MongoDB MMS
- In-Application
  - Codahale Metrics
  - Graphite
  - Grafana
- OpsGenie for the devOps

# Agenda

EB Cloud

How things were done in the past

Cloud Computing

Scalability

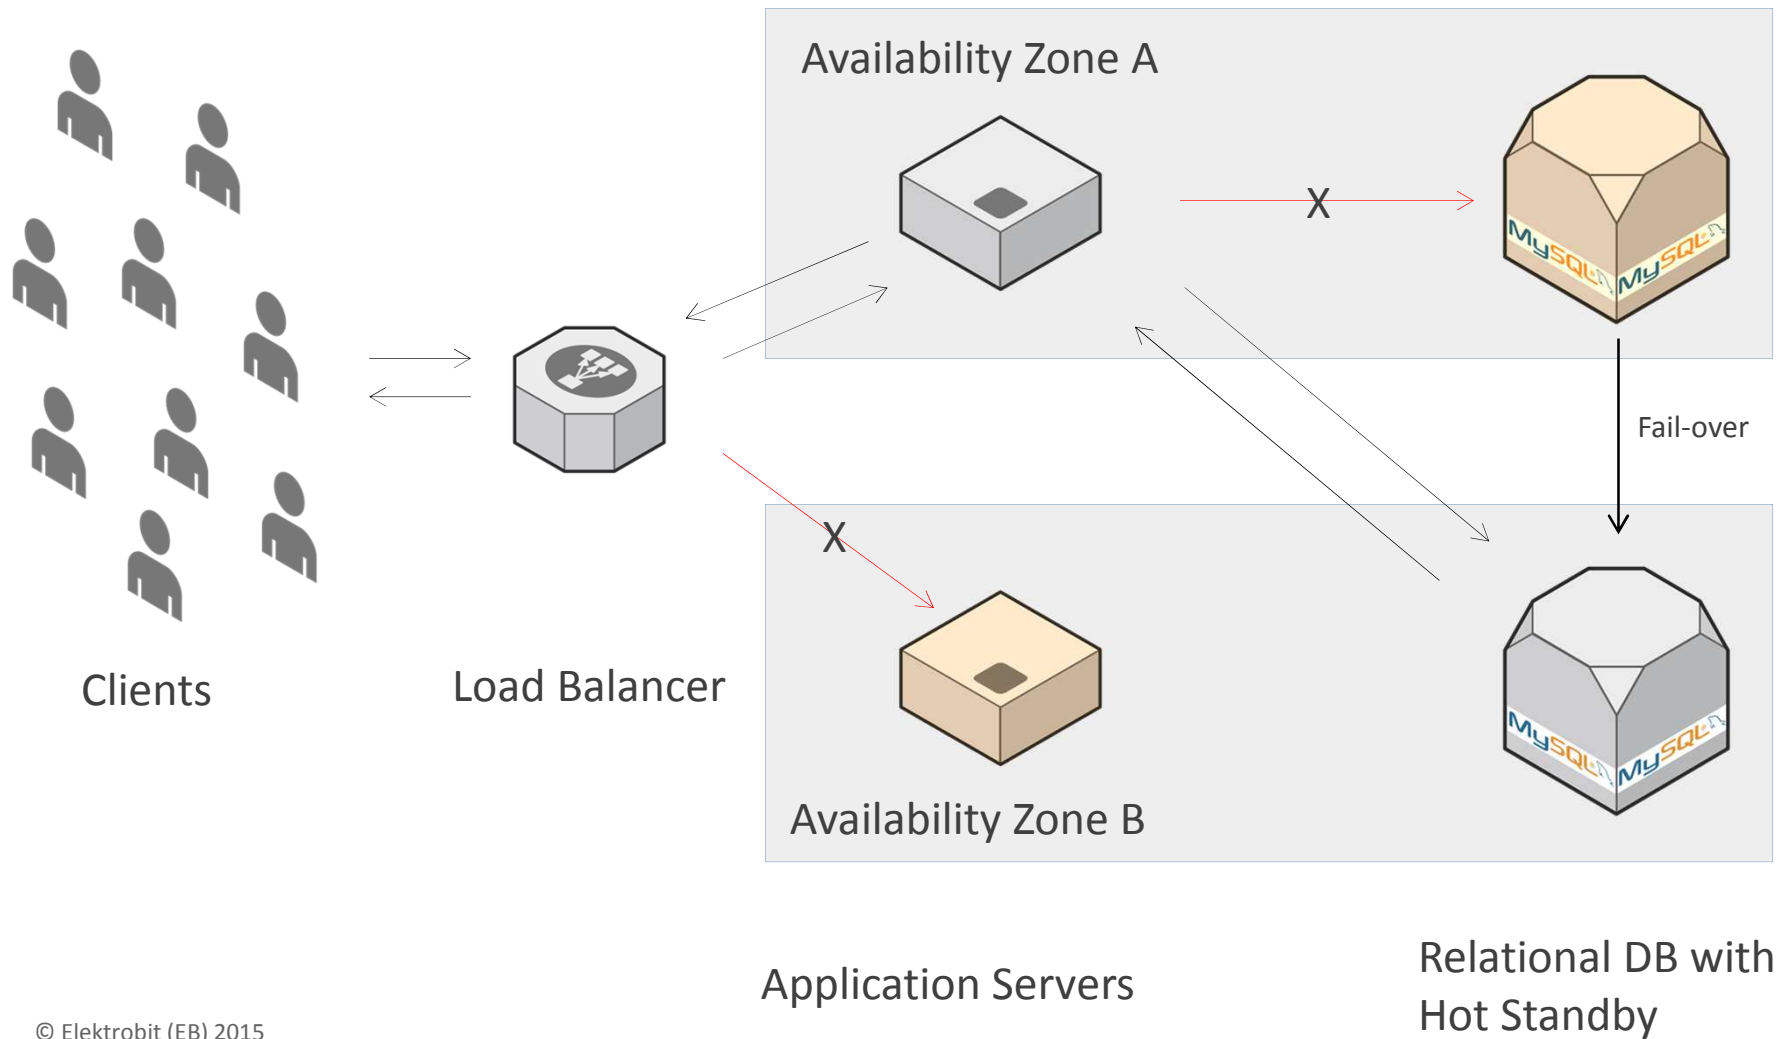

**Availability**

Cost & Operations

Overview & Outlook

# Fault-tolerant web application

# Avoid single points of failure

---

- Stateless application
- Disposable nodes
- Single LDAP server was replaced by DynamoDB  
(Multi-Master setup proved to be very difficult)
- PostgresDB was replaced by MongoDB Cluster
- WebMapper session fail-over using Hazelcast

# Auto scaling

---

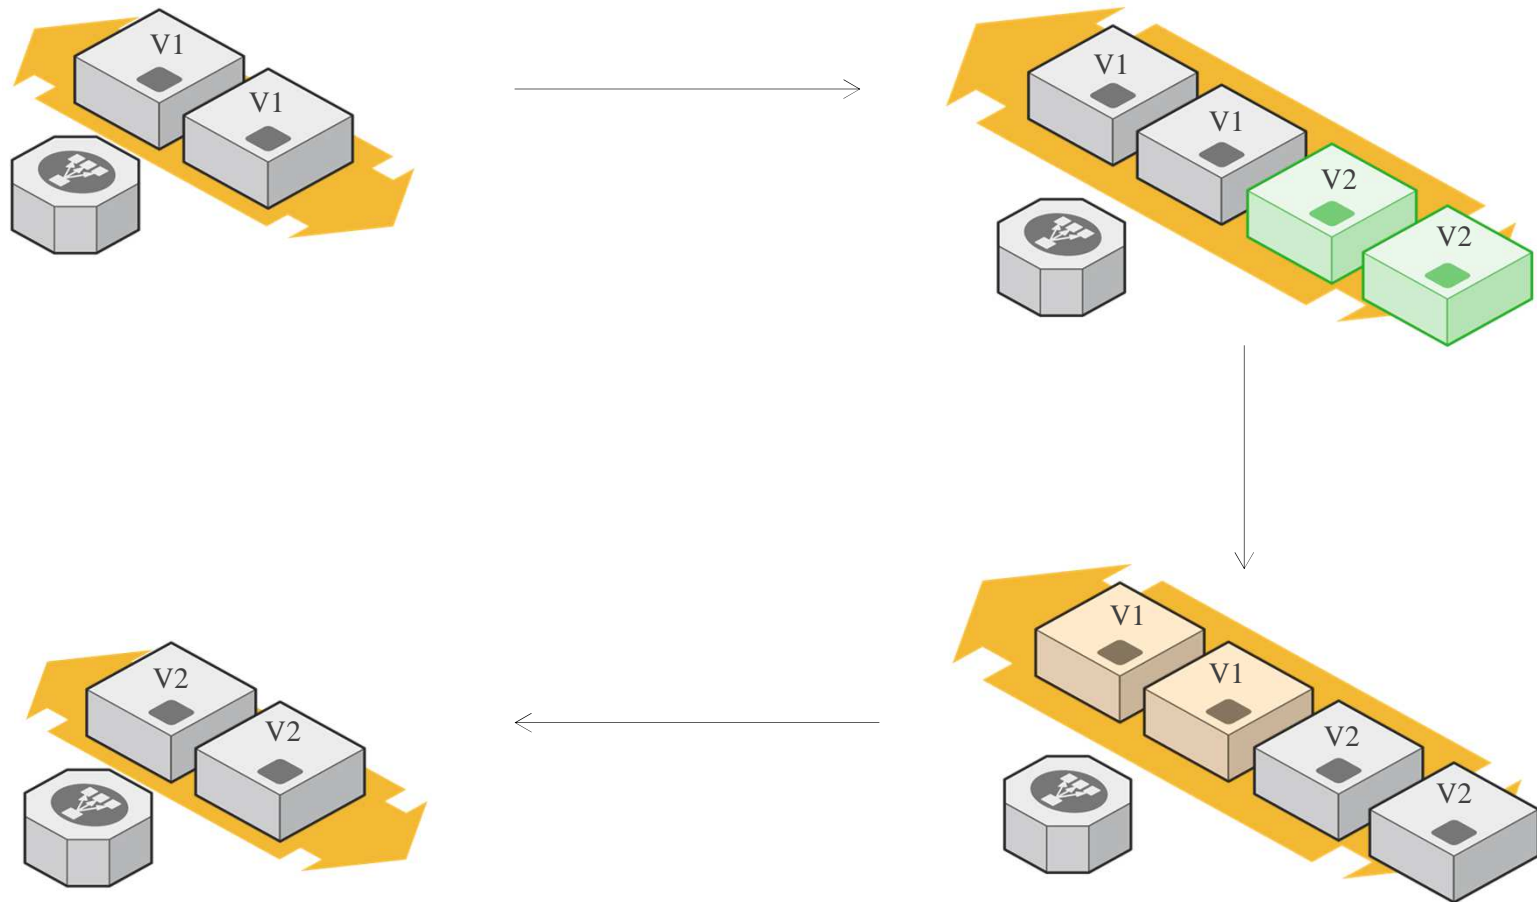

- Amazon automatically starts and stops nodes to match system load
- Auto scaling supports multiple availability zones
- Auto scaling even for a single instance (Watchdog for cron job node)

# What happened?

# Rolling Updates

# Service Discovery

# Global scaling and fail-over

---

- Cloudfront used for fast global map download
- Global request routing using DNS (Route53)
- Potential deployment in different AWS regions world wide

# Agenda

EB Cloud

How things were done in the past

Cloud Computing

Scalability

Availability

**Cost & Operations**

Overview & Outlook

# Deployment learnings

---

- Select the right machine type for the job
- Automate using auto-scaling (No manual intervention necessary)
- Use PaaS when possible (No overhead maintaining machine images)
  - Elastic beanstalk
- Avoid DIY, use managed services where possible  
(Potential drawback: Vendor lock-in)

# Security & Operation

---

- Separate AWS accounts for production data
- Strict role & rights management
- External company for security audit
- Limited access to production data & DB encryption for data security

# Agenda

EB Cloud

How things were done in the past

Cloud Computing

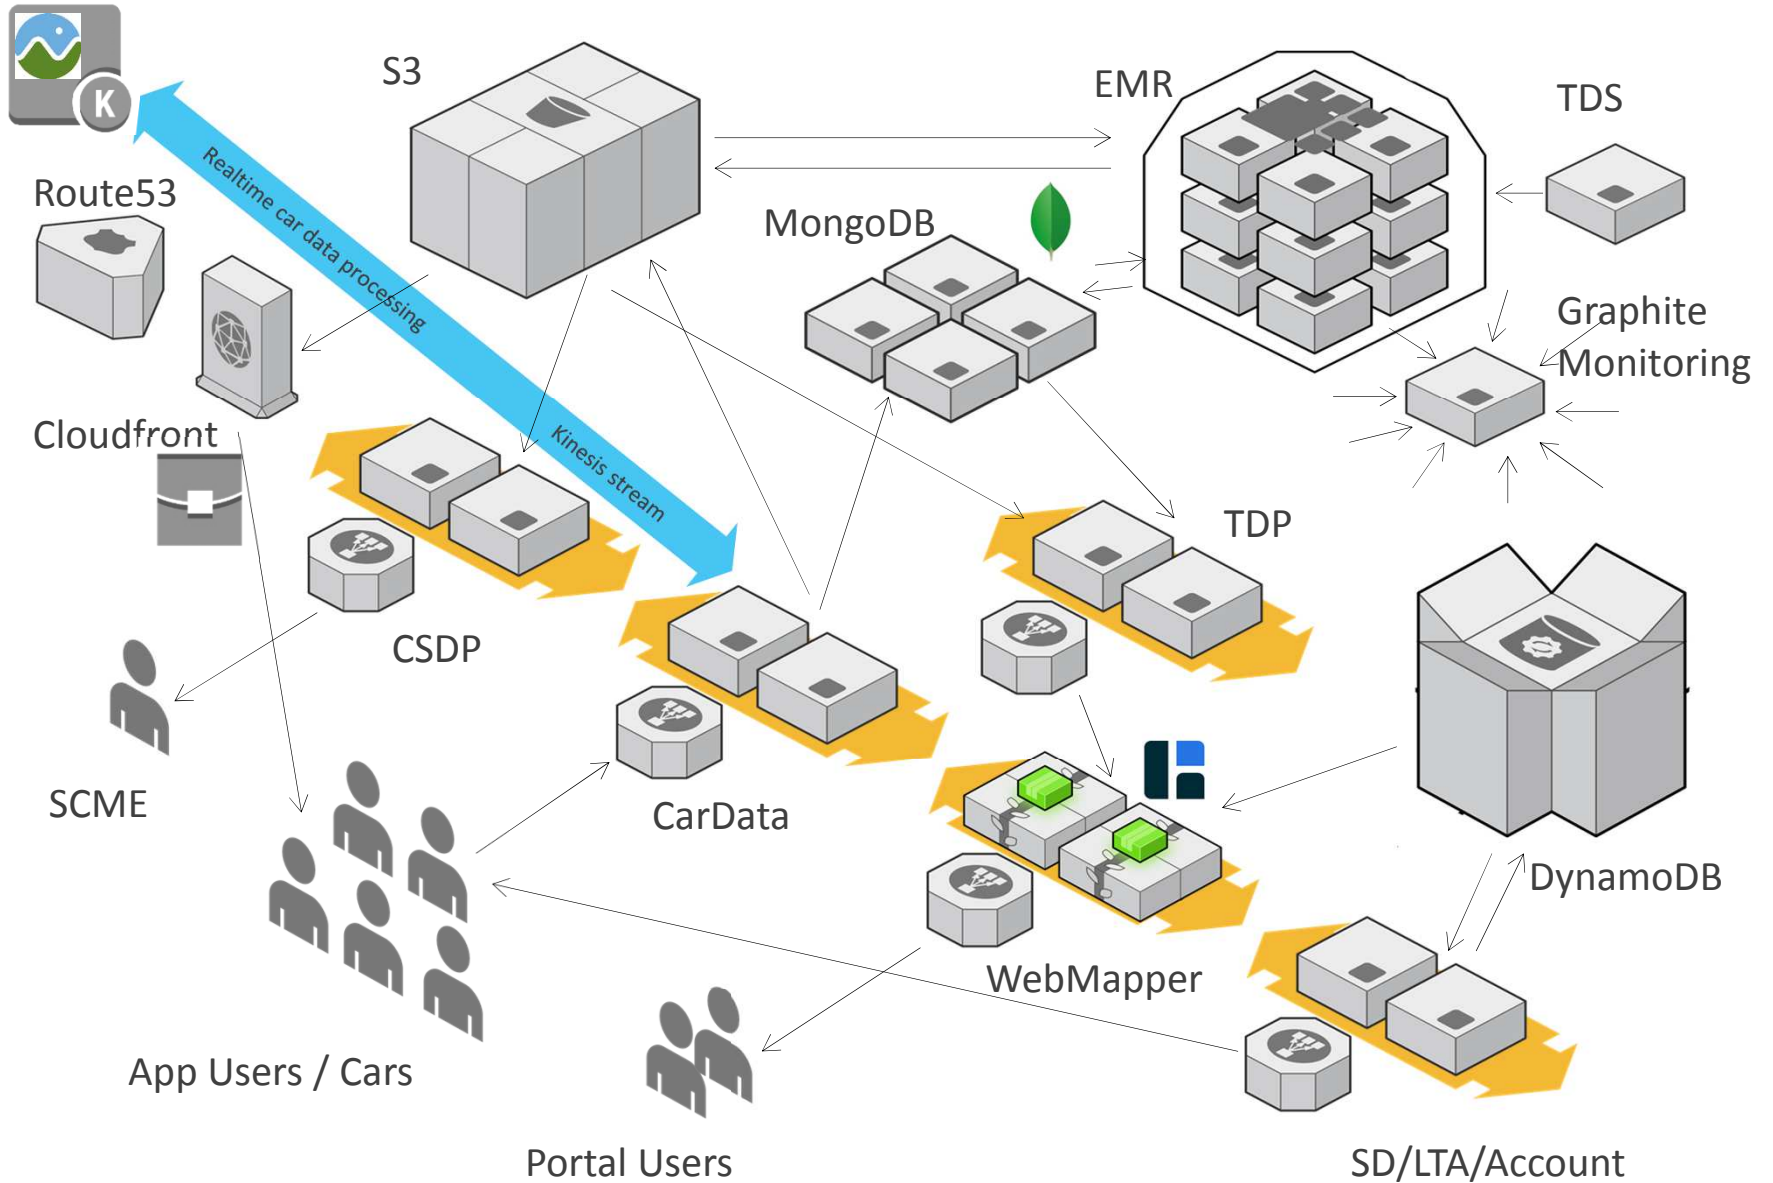

Scalability

Availability

Cost & Operations

**Overview & Outlook**
